Implementation Plan: Full CRUD Options for Registered Customers

Goal Description

Provide Super Admins and authorized managers with a full **CRUD (Create, Read, Update, Delete)** suite for **Registered Customers** directly within the **Staff Roles & Registered Users** dashboard (). Currently, administrators can view customer accounts, grant loyalty points, and toggle active status. With full CRUD options, administrators will also be able to:

1. **Create (C)**: Manually register new customers from the admin portal (useful for telephone orders or VIP patrons).
2. **Read (R)**: View complete customer profile metadata (order history summary, delivery address, phone, email, points balance).
3. **Update (U)**: Edit customer details (name, phone, email, delivery address, password reset, loyalty points balance).
4. **Delete (D)**: Delete or purge test/invalid customer accounts with confirmation safeguards.

Architecture & Data Flow

User Review Required

> IMPORTANT
>
> **Data Integrity on Deletion**: Deleting a customer will check if the user is a protected administrator (`id = 1` cannot be deleted). For customers with prior orders, orders in MySQL are preserved with the historical customer name & phone for sales audit and fiscal compliance (RRA EBM).

> NOTE

> **Password Handling for Manually Created Customers**: When an admin adds a customer without specifying a password, a secure default (`ineza2026`) is assigned, and the customer can change it anytime. When editing an existing customer, the password field is optional (only updated if filled).

Proposed Changes

1. Backend API Layer ()

[MODIFY]

- Add `action === 'create_customer'`:
  - Validate name, phone (Rwanda format normalized), email.
  - Insert user with `role = 'customer'`, `loyalty_points`, and optional address.
- Add `action === 'get_customer'`:
  - Fetch detailed customer object by ID.
- Add `action === 'update_customer'`:
  - Update `full_name`, `phone`, `email`, `address`, `loyalty_points`, and optional `password` (bcrypt hashed if provided).
- Support `action === 'delete'` with safeguard for admin accounts.

2. Staff & Admin Dashboard Markup ()

[MODIFY]

- Add `+ Add New Customer` button in the header of the Registered Customers section.
- Add **Customer Modal (`#customerModal`)**:
  - Fields: `Full Name *`, `Phone Number *`, `Email Address *`, `Delivery Address / Landmark`, `Loyalty Points Balance`, `Password (Optional / Reset)`.
- Update customer table action buttons to include:
  - **Edit** icon (`openEditCustomerModal(id)`).
  - **Delete** icon (`deleteCustomerAccount(id)`).
  - **Grant Pts** shortcut button.

3. JavaScript Logic ()

[MODIFY]

- Implement:
  - `openAddCustomerModal()`
  - `openEditCustomerModal(id)`
  - `closeCustomerModal()`
  - `confirmSaveCustomer(e)`
  - `deleteCustomerAccount(id)`
- Update `filterUsersTable()` to render Edit, Status Toggle, Grant Points, and Delete buttons in the Actions column.

Verification Plan

Automated / API Tests

1. **Create Customer via API**:
   - `POST api/users.php` with `{ action: "create_customer", full_name: "Eric Gisa", phone: "0788998877", email: "eric.gisa@gmail.com", address: "Kacyiru, Kigali" }`.
   - Verify 200 OK + new ID created in MySQL.
2. **Update Customer via API**:
   - `POST api/users.php` with `{ action: "update_customer", id: <new_id>, address: "Kimihurura, Kigali", loyalty_points: 2000 }`.
   - Verify fields updated in MySQL.
3. **Delete Customer via API**:
   - `POST api/users.php` with `{ action: "delete", id: <new_id> }`.
   - Verify record removed from MySQL.

Manual UI Verification

1. Open `http://localhost/ineza_resto_cafe-shop/admin.html`.
2. Navigate to **Staff & Loyalty** tab (`#tab-users`).
3. Click **+ Add Customer**, enter VIP details, and click Save. Verify instant appearance in the table.

4. Click the **Edit** icon on a customer row, change their delivery address and loyalty points, and save. Verify updated info.
5. Click **Delete** icon on a test customer, confirm dialog, and verify row is removed.
