Implementation Plan: Robust User Registration & Login System

Goal Description

Enhance and unify the User Registration & Login system across **INEZA RESTO & COFFEE SHOP** (Web App `index.html`, Mobile PWA `mobile_app.html`, and Staff Portal `admin.html`). Currently, the system has backend PHP API endpoints in `api/auth.php` and dual local storage fallbacks, but experiences:

1. Slight parameter mismatches in action parsing when posting JSON vs form-encoded payloads.
2. Incomplete linking between logged-in user profile and the order placement checkout fields (customer address, previous orders).
3. Legacy placeholders in the admin login tab (`admin_Favorite Cafe` instead of INEZA RESTO branding).
4. No direct user order history filter so customers can view *their own* past orders upon logging in.
5. Incomplete session synchronization between tabs and views (e.g. logging in on desktop navbar vs opening mobile view).

Architecture & Data Flow

User Review Required

> IMPORTANT
>
> **Phone Number as Primary Identifier in Rwanda**: Most customers in Kigali order via mobile and identify primarily with their MTN or Airtel phone number (e.g. `0788123456` or `+250788123456`). The login endpoint already supports email OR phone, and we will ensure the front-end inputs explicitly encourage both.

> NOTE

> **Offline & Hybrid Local Storage Resilience**: The system keeps a local storage fallback (`favcafe_registered_users` and `favcafe_active_user`) so that the application functions seamlessly even when offline or when hosted in static environments (such as GitHub Pages previews), while connecting directly to MySQL when running on localhost / production PHP servers.

Proposed Changes

1. Backend Authentication API & Database Layer

[MODIFY]

- **Universal Payload Parsing**: Ensure both `$_GET['action']` and `$data['action']` (JSON body) work identically without edge-case drops.
- **Normalize Rwandan Phone Numbers**: Sanitize phone numbers uniformly (e.g., stripping `+250`, leading `0`, spaces, and dashes) so that a user registering with `0788 123 456` can log in with `+250788123456`, `0788123456`, or their email.
- **Support Order History Retrieval**: Add action `get_user_orders` allowing an authenticated user to fetch all their past orders filtered by `user_id` or `phone` / `email`.
- **Default Admin Account Seeding**: Auto-create default admin credentials (`admin@ineza.rw` / `admin2026`) in MySQL if not present, ensuring staff login works out-of-the-box.

2. Frontend Customer Web App (`index.html` & `js/main.js`)

[MODIFY]

- **Update Branding in Auth Modals**: Replace remaining legacy strings (`admin_Favorite Cafe`) with `admin@ineza.rw` or `INEZA Resto Admin`.
- **User Profile Pill & Dropdown**:
  - Enhance the `#navAuthBtn` in the navbar.
  - When logged in, clicking the user button displays an elegant quick profile modal / drawer showing:
    - User's name, phone, email, and loyalty points.
    - Quick link: **My Order History** (with live status tracking).
    - Quick link: **Edit Delivery Address**.

        - **Sign Out** button.
- **Pre-fill Checkout Form**:
    - Automatically bind logged-in user credentials (`full_name` , `phone` , `address`) to the checkout drawer so customers do not have to re-enter their details on every order.

[MODIFY]

- **Strengthen `processClientLogin()` & `processClientRegister()`**:
    - Ensure robust JSON posting with full error toast feedback.
    - Add session auto-refresh on page load (`checkUserSessionStatus()`).
    - Add `loadUserOrders()` to populate the "My Orders" modal dynamically with real orders from `api/orders.php` .

3. Mobile PWA View (`mobile_app.html` , `mobile_auth.html` , `js/mobile_app.js`)

[MODIFY]

- Ensure consistency in storage keys with desktop (`favcafe_active_user`) so users logged in on one interface remain logged in across all views.
- Add phone/email toggle assistance and clean Rwandan phone number validation (`078` , `079` , `072` , `073`).

4. Staff & Admin Authentication (`admin.html`)

[MODIFY]

- Add a session verification check on `admin.html` :
    - If a user opens `admin.html` without staff/admin privileges, show a clean, branded Staff Sign-In modal or redirect them back with a polite toast notice.
    - Display the logged-in staff member's name and role in the sidebar user card (`Admin Staff` ➔ active staff name).

Verification Plan

Automated / API Verification

1. **API Registration Endpoint**:
   - Register a new customer via `POST /api/auth.php?action=register` with valid phone and password.
   - Verify 200 response with created user object and hashed password in DB.
2. **API Login with Email**:
   - Verify login using registered email.
3. **API Login with Phone Number**:
   - Verify login using Rwandan phone formatted with and without international prefix `+250`.
4. **API Order History Filter**:
   - Verify `api/orders.php` returns orders matching the user's phone or identifier.

Manual UI Verification

1. **Desktop Web App (`index.html`)**:
   - Open `http://localhost/ineza_resto_cafe-shop/index.html`.
   - Click **Login / Account** in navbar.
   - Switch to **Register** tab, enter details, and submit.
   - Verify success toast, modal close, and navbar button updating to the user's first name with active badge.
   - Open Cart drawer: verify Customer Name and Phone Number are pre-filled automatically.
   - Click navbar user button: verify Account Profile view with "My Orders" and "Sign Out".
2. **Mobile App (`mobile_auth.html` & `mobile_app.html`)**:
   - Test login and check that session is maintained.
3. **Admin Dashboard (`admin.html`)**:
   - Verify staff login credentials and sidebar user card display.
